Define your problem statement

1. Define your problem statement

Brainstorm

Brainstorming is a creative process that generates ideas. It is a collaborative process that involves a group of people working together to generate ideas. The process is typically facilitated by a facilitator who encourages participants to share their ideas and build on each other's ideas.

Group ideas

Group ideas are ideas that are generated by a group of people. They are often the result of a brainstorming session or a collaborative effort. Group ideas can be used to solve problems, create new products, or improve existing ones.

Prioritize

Prioritization is the process of ranking ideas based on their importance or value. It is a key step in the idea prioritization process. There are many ways to prioritize ideas, but one common method is to use a graph that plots ideas against two dimensions: impact and effort. This allows you to see which ideas have the highest impact for the least effort, and which ideas are more complex or require more resources.
